

User Manual

Post-processing in (QT + Python) GUI:
Post-Processing Plotter (Pcube)

Ajey Dikshit

June 2022

1 Steps to load the file in QT Creator

1. Ensure QT Creator version 5.12 is installed with the required Python packages.
2. Extract the download github zip. A tree of the extracted file is shown in Figure 1.

Name	Size
__pycache__	
12.csv	6,337 KB
Datafile_1.csv	233 KB
form.ui	10 KB
form1.ui	1 KB
functions.py	8 KB
mainwindow.py	14 KB
mplwidget.py	1 KB
Post_processing.pyproject	1 KB
Post_processing.pyproject.user	13 KB
user_defined_func.py	2 KB

Figure 1: Extracted files from the github zip.

3. Open the *.pyproject file in the QT Creator.
4. Set the run configuration to `mainwindow.py` as shown in the Figure 2.

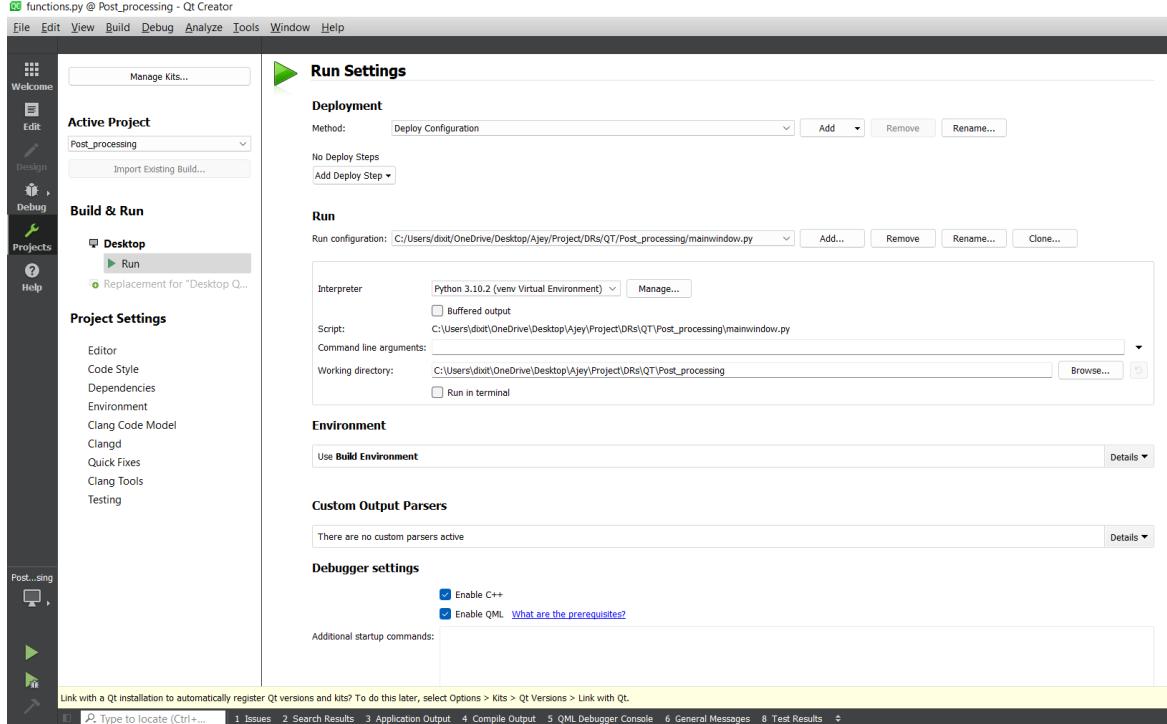

Figure 2: Changing the run configuration for a project.

5. Switch to edit mode and then click run (green triangle) button or press **Ctrl + R** for executing the project. With a successful run, the following Pcube GUI will appear (see Figure 3).

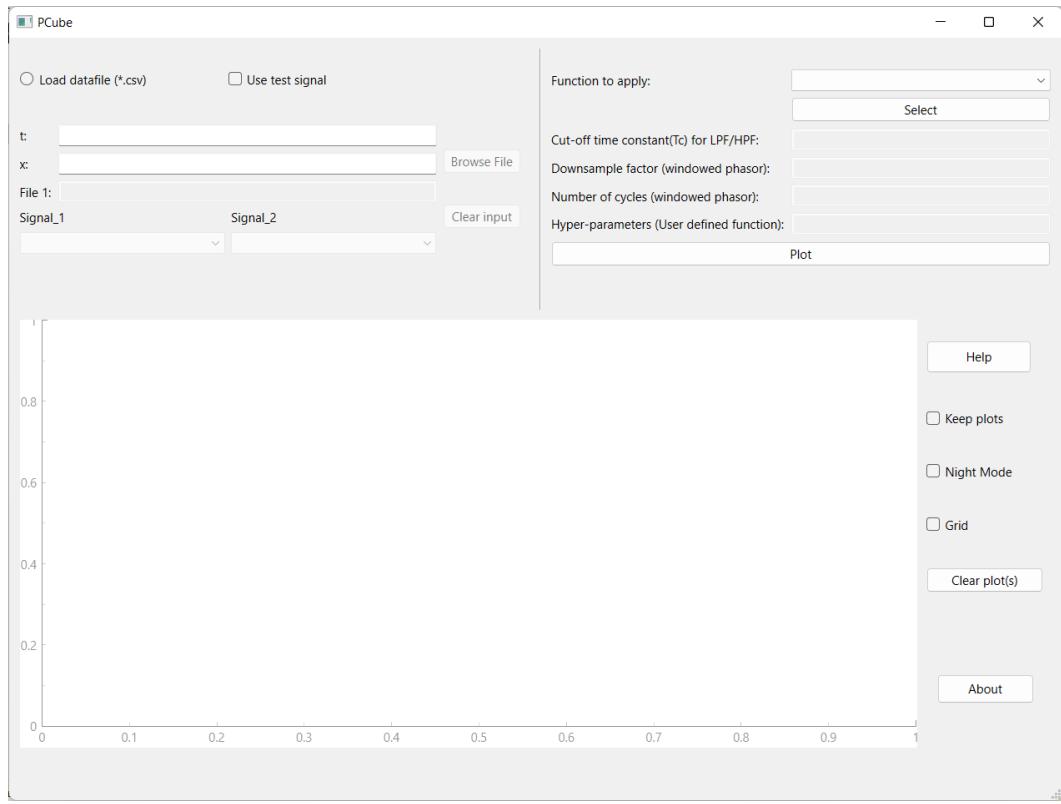

Figure 3: Pcube GUI

2 Using the Pcube GUI

There are three main area of Pcube GUI, these are input area, function area, and the plotting area as shown in Figure 4.

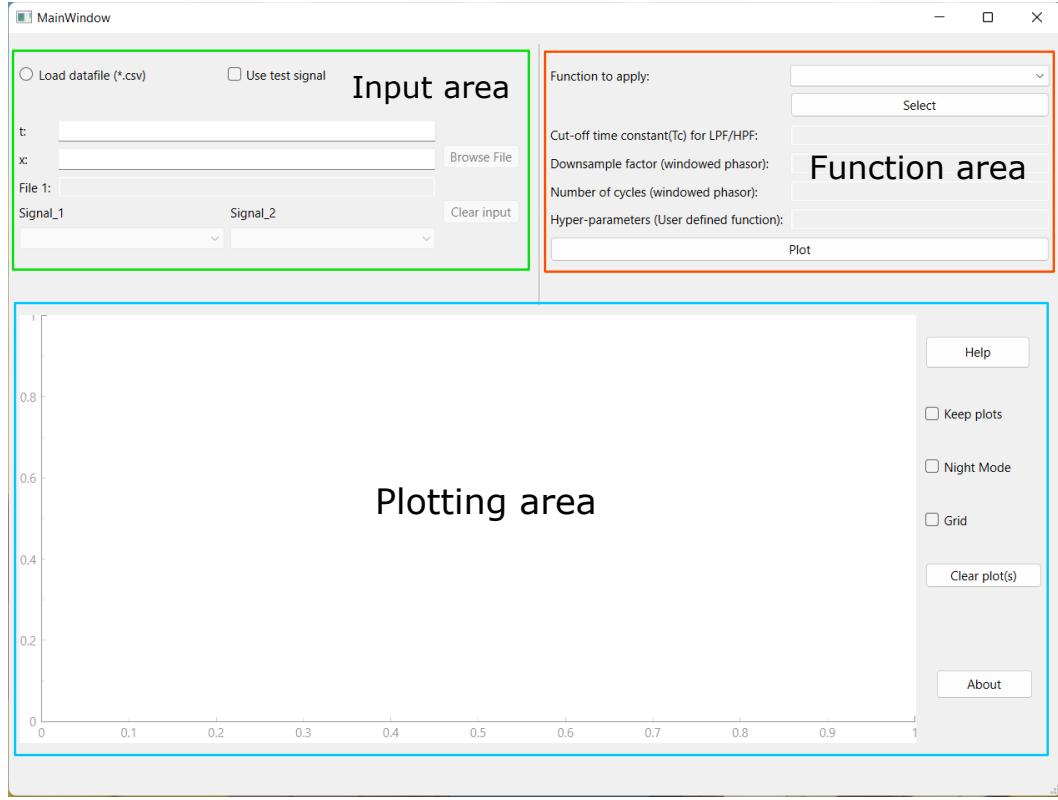

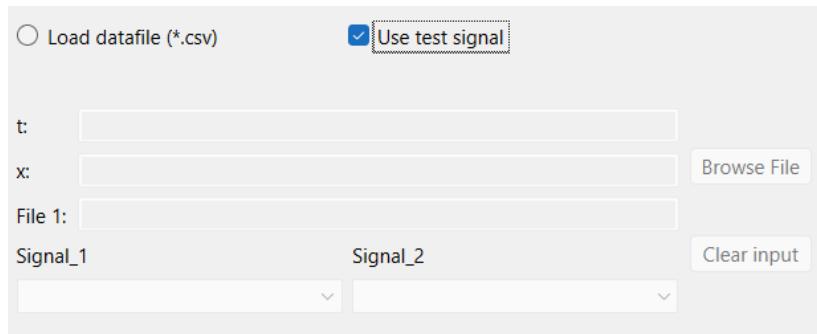

Figure 4: GUI

Input area of Pcube, facilitate three modes of data entry which are listed below:

1. The quickest data entry can be made using the test signal check button. This test signal is a pre-defined signal containing a signal with multiple harmonics mainly DC, 50 Hz, and 500 Hz component. This feature can be used to test various post-processing functions quickly in Pcube GUI.

2. Using expressions: here a signal can be constructed using standard python mathematical syntax.

Load datafile (*.csv) Use test signal

t: `np.arange(0, 0.5, 1e-5)`

x: `10*np.sin(2*np.pi*50*t)`

File 1:

Signal_1 Signal_2

3. Using *.csv upload file feature: Here the first row of the *.csv file should be present, since these entries will be used in the signal slots as shown below. Signal_1 slot is for x-axis whereas Signal_2 slot is for the y-axis in the plot.

Load datafile (*.csv) Use test signal

t:

x:

File 1: `'Datafile_1.csv'`

Signal_1 Signal_2

Function area of Pcube, facilitates various post-processing functions which can be applied on the signals uploaded from the input area. These functions are listed in the following figure.

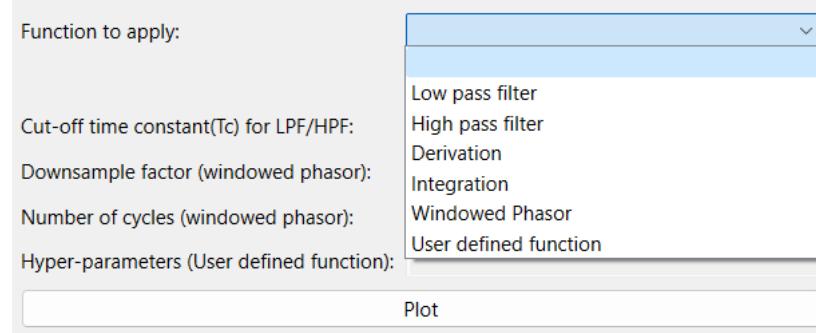

Figure 5: List of the post-processing functions.

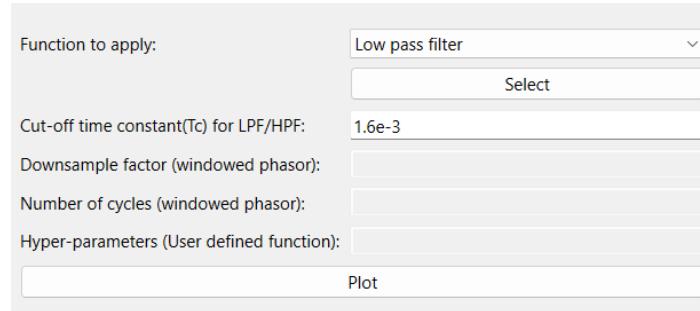

Figure 6: First order low pass filter

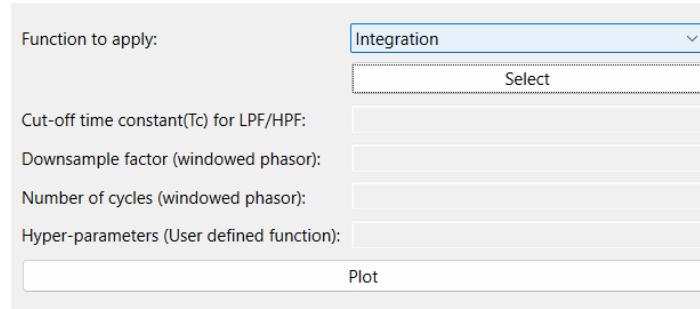

Figure 7: Integration

Function to apply:	Windowed Phasor
	<input type="button" value="Select"/>
Cut-off time constant(Tc) for LPF/HPF:	
Downsample factor (windowed phasor):	100
Number of cycles (windowed phasor):	1
Hyper-parameters (User defined function):	
	<input type="button" value="Plot"/>

Figure 8: Windowed Phasor

Function to apply:	User defined function
	<input type="button" value="Select"/>
Cut-off time constant(Tc) for LPF/HPF:	
Downsample factor (windowed phasor):	
Number of cycles (windowed phasor):	
Hyper-parameters (User defined function):	[100, 1]
	<input type="button" value="Plot"/>

Figure 9: User defined function

Plotting area of Pcube, provides a canvas area where the input signals and the post-processed version of the signals are plotted.

3 User defined function

When writing an user defined function, the user has to keep few things in mind.
The input for the function has to be 3 arguments, which should include 2 inputs followed by a list of all the other inputs, the code has to be written using the list indexing. Even if no parameters exist, a 3rd argument must be passes (just don't use it in the function).An example has been given below:

```
def user_func(t, x, tc):
    h = t[1] - t[0]
    y = np.zeros(len(t))
    i = 0
    while i <= len(x) - 1:
        y[i] = (x[i] - x[i - 1]) / h
        i = i + 1
    return [y, t]
```

If the user defined function has no hyperparameters they have to pass an empty list [] in the hyper-parameter column, the name of the user defined function can't change, and the function must return 2 values.

If giving file input, it is better to have a row dedicated to headers as it will make the user's life quite easy.
